

UniqueHuman — Take-Home Assessment

CONTEXT

People with chronic conditions carry enormous context — wearables, medical records, chat history, past medications, lifestyle patterns, external triggers. Most health tools make the user do the work of connecting the dots, and most are reactive: nothing happens unless the user opens the app first.

UniqueHuman is a **proactive intelligence and autonomous health management platform**. We know the user across every connected source, understand their context, and speak up at the right moments.

THE PROBLEM STATEMENT

Using the health data provided for the 10 users, build what you think is the most useful proactive solution to help them manage their chronic conditions. The solution should:

- Know each user across all their connected data and full health context
- Speak up at the right moments — without waiting to be asked
- Be interactive — let users ask follow-ups on any alert, dig deeper, and explore next steps

DELIVERABLE

- Fully implemented working demo
- Code pushed to a GitHub repo, and a demo / walkthrough video up to 10 minutes

WHAT YOU GET

- Health data for 10 users
 - A Claude API key
- Feel free to pull any external data, although not required.

WHAT WE EXPECT

- **Personalization.** Supports all 10 users and behaves differently for each.
- **End-to-end.** Stack, UI, storage, features — where you spend time is your call.

GUIDELINES

You have complete freedom to define what to build. How you scope it, pivot as you go, and decide what to ship vs. cut is all part of the evaluation. Skip the boilerplate (CRUD, auth) and spend your time on what's unique.

EVALUATION CRITERIA

- **Systems thinking** — how you reason about the architecture and tradeoffs.
- **Agentic reasoning** — how the system decides and acts on the user's behalf.
- **Product sense** — what you choose to build, and why.
- **Implementation** — what actually works at the end of three hours.
- **AI fluency** — how natively you use AI tools to supercharge your work.

PROCESS & SUBMISSION

You have **3 hours**. Then:

When	What
T+0:00	Start building.
T+3:00	Stop coding. Push to a GitHub repo with a README; give Praneeta and Anshul access.
T+3:10	Reply all to the assignment email with the repo link.
T+4:00	Reply all on the same thread with the walkthrough video link (<i>Drive / Loom / YouTube — anywhere publicly viewable</i>).
